design combinational logic circuits • Combinational logic circuits do not have an internal stored state, i.e., they have no memory. Consequently the output is solely a function of the current inputs. • Later, we will study circuits having a stored internal state, i.e., sequential logic circuits.

done in the context of a digital electronics lab, comparing the LabVIEW simulations with real integrated circuits. In each case, you can enhance simulations presented in the text by using a National Instruments DAQ board to interact with the real world through LabVIEW digital I/O, analog out, analog in, and serial VIs.

With reference to the chapter "Digital Electronics Basics - Chapter 1: Logic Gates & Boolean Algebra" In the Example problem, I am confused about the third logical gate used (U2 / OR2). Is it the right gate used? The output indicated in the dig for OR2 shows the output for AND Gate. Hence the LED output would be incorrect.
